

Server Backup Manager

Block-based backup purpose built for service providers.

What is Server Backup Manager?

R1Soft Server Backup Manager (SBM) offers a flexible, server-friendly backup solution that eliminates the pains of running traditional backups in your environment. SBM starts by taking an initial replica of your entire data set, and then continuously monitors changes to that data, saving only the bits of information that have changed since the last backup. This SBM's web-based console allows you to select individual files, directories, or entire file systems to be restored within minutes, all from a single pane of glass.

BENEFITS

Fast

Backup up your data as frequently as every 15 minutes with incremental backups performed at the block level.

Flexible

Backup any system you want to any location you want - physical or virtual, on- or off-site.

Scalable

Built to scale to the needs of the largest hosting providers, SBM allows you to manage thousands of servers with a single, web-based console. Users can select individual files, directories, or entire file systems to be restored within minutes.

Proven

Developed with hosting providers in mind, SBM is used by nearly 1,800 service providers, protecting 250,000 servers.

Affordable

SBM comes with everything included - no hidden fees or additional modules required.

Secure & Reliable

SBM uses industry standard encryption and reliable technology to ensure that your data is secure and accessible when you need it.

FEATURES

Continuous Data Protection®

Rather than constantly running full, performance-killing backups, our CDP technology keeps critical resources free to serve your clients' needs. It takes an initial snapshot of your data, then continuously monitors changes to your data, saving only the bits of information that have changed.

Site-to-Site Replication

Site-to-Site provides hosting providers with a simple means of replicating backup data across SBM servers regardless of their geographic location.

Robust API

Our powerful SOAP API allows you to automate administrative tasks and integrate with your billing or provisioning systems.

- Block Level
- Multi-Tenant
- Self-Service File Restore
- Disk Safe Verification
- Bare Metal Restore
- Multi-Platform
- Granular File Restore
- Virtual Full Backup
